

The LifeNet Health Safety Advantage

LifeNet Health has a comprehensive range of measures in place to ensure the safety of your allograft bio-implant. It's no coincidence that we have distributed over 1.7 million allografts since 1995 without an incidence of disease transmission.

An Extensive Network of Recovery Partners

- LifeNet Health only accepts donors from federally designated Organ Procurement Organizations (OPOs) and/or qualified tissue recovery partners.
- Audited to guarantee that their recovery process meets current FDA regulations, AATB standards and LifeNet Health's own guidelines.

Stringent Screening and Review

- A rigorous screening process, including medical history and behavioral risk assessment.
- A complete donor report obtained from the next of kin and/or person most qualified to provide accurate information on the donor, including any autopsy results.
- Reviewed and signed by LifeNet Health medical director.

Comprehensive Recovery Protocol

- A specialized team dispatched to recover the tissue under strict LifeNet Health guidelines, including a physical assessment and thorough review of all medical records.
- Donor tissue is recovered using the safest recovery techniques and sterile equipment to minimize any bioburden contamination.
- Recovered tissue is sampled and tested for microbiological contamination. Blood and other samples are obtained for serological testing.
- Sterile wrapping and storage of the tissue at appropriate temperatures.

Cleaning and Sterilization with Allowash XG®

- A patented and validated process that removes greater than 99% of bone marrow and blood elements from the internal bone matrix.
- Along with chemical treatment and other sterilization measures, Allowash XG has been shown to render a Sterility Assurance Level (SAL) of 10^{-6} and to inactivate viruses without compromising the biomechanical or biochemical properties of the tissue.
